Title: Paper storage system for installations with automatic coupling device

Abstract: The object of the present invention is a paper storage system, for installations with automatic coupling device, system which is determined by a group of fixed rollers and movable rollers, situated according to correlations of rows and columns perpendicular to one another, in which each row of movable rollers, in the initial threading phase of the paper band remains situated between two rows of fixed rollers, reaching a paper storage system which allows to accumulate a great length of the band of paper occupying a reduced space.
